

InDesign Tutorial

Learning Adobe InDesign: Side by Side Pages

Arranging pages side by side in your page layout.

When creating a new page layout, InDesign gives you two choices Facing Pages (for saddle stitched books) or uncheck the box for non facing pages. You can arrange pages side by side with either facing or non facing pages. When creating pages for a tri-fold brochure, it's best to create your document to final size, but you could also create 3 pages side by side with this nifty guide.

STEP 1

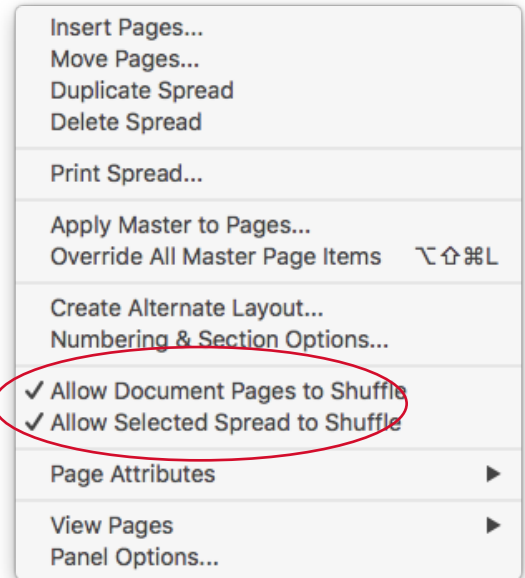

Create any number of pages in the new document dialog box.

STEP 2

In the pages panel, right click on any of the page icons. Remove the checkmark by Allow Document Pages to Shuffle.

STEP 3

Now you can drag any number of pages to be next to each other in the panel. When you drag a page onto another page, a bracket and a small arrow appear to show which side the page will fall once you release it.

STEP 4

When designing using side by side pages, you can rearrange the pages at any time, but any graphics that cross over from one page to another will move with the left hand page.

STEP 5

After the project is ready to go, remember to choose Spreads when you export your pdf so that all the side by side pages are together.
